

Mini-Drinker Install Tips

The Rainmaker Mini-Drinker is a durable, easy to install water drinker for birds, bees and critters. It includes a float-valve for easy regulation of water flow. This valve will work with water pressure between 4-60 psi. Disconnect and drain during hard freezes to avoid damage.

Add Weight Inside Drinker?

Some animals, like raccoons, will naturally fiddle with water and food dishes. You can add some extra weight by pouring sand or gravel through the fill-port on the side.

Attaching Hose

Attach a standard 3/4" garden hose to the brass swivel adapter. Take care not to rotate the entire brass fitting as this will rotate the float-valve inside the drinker.

The float-valve comes pre-adjusted. If you would like to make any adjustment, simply remove the black cover and adjust the wingnut and valve.

If you are attaching the drinker to a pipe fitting, rather than the garden hose fitting, you'll need to get a 3/4" female pipe to 3/4" female pipe adapter.

Adding Rocks

You can add some rocks to give birds and bees a solid perch for drinking and bathing.
