

New Walk-In Drinker For Large Capacity Wildlife Water Systems

Create a high capacity watering system for elk, big horned sheep and deer. The new "Walk-In" drinker gives animals easy access to water at any level by steps or ramp. The drinker and storage tanks are commonly set up as a equilibrium gravity feed system for simplicity and dependability.

The Walk-in drinker is made of extra thick polyethylene in a double-wall construction. Sidewalls and floor are stiffened with internal stringers and structural foam for a solid feel. Steps accept commonly available 12" cement pavers (not included in shipment). 3" bulkhead fitting included.
